THE EFFECT OF OXIDATION ON THE HIGH HEAT FLUX
BEHAVIOR OF A THERMAL BARRIER COATING

Robert A. Miller
NASA Lewis Research Center
Cleveland, Ohio 44135

The effect of oxidation on the high heat flux behavior of a thermal barrier coating has been evaluated by cyclically exposing preoxidized specimens to a 3000°C nitrogen plasma. The thermal barrier coatings consisted of a 0.025 cm layer of air-plasma-sprayed $ZrO_2-7\%Y_2O_3$ and a 0.012 cm layer of low pressure-plasma-sprayed NiCoCrAlY applied over 0.13 cm diameter B1900+Hf cylindrical substrates. A gradient of 800°C is produced across the ceramic layer in each 0.5 second exposure. This is much more severe than the gradient encountered on a gas turbine engine. Prior to exposure, the specimens were preoxidized at 1200°C for times from 0 to 20 hours.

These coatings were found to be tolerant to the high heat flux plasma flame for all but the most severe preoxidations. However, life degraded rapidly for preoxidation times in excess of 15 hours at 1200°C. A log-log plot of cycles-to-failure vs. estimated oxidative weight gain yield a straight or nearly straight line, and this line could be rationalized using an oxidation-based model that had been developed previously for low heat flux applications.

THE STORY SO FAR -

- AS - SPRAYED 0.04 cm $ZrO_2 - 8\% Y_2O_3$ TBCs TOLERATE LOCALIZED HIGH HEAT FLUX GREATER THAN EXPECTED IN GAS TURBINE ENGINE
- HIGH HEAT FLUX LIFE MAY BE SEVERLY DEGRADED BY PREOXIDATION
- INERT HEAT TREATMENT NOT HARMFUL (AND APPARENTLY BENEFICIAL, SEE THIN SOLID FILMS II9, 195 (1984).

THE NEXT STEP

- QUANTITATIVELY RELATE TBC OXIDATION TO HIGH HEAT FLUX LIFE.

TBC LIFE MODEL DEVELOPED FOR LOW HEAT FLUX
J. CERAM SOC. 67,517 (1984)

ASSUMPTIONS

- TIME DEPENDENCE - OXIDATION, W
- CYCLE DEPENDENCE - SLOW CRACK GROWTH DUE TO CYCLIC STRAIN
- OXIDIZED SPECIMEN BEHAVES AS IF CYCLIC STRAIN INCREASES

WORKING EXPRESSION

$$\sum_{N=1}^{N_f} [(1 - \epsilon_r / \epsilon_f) (w_N / w_c)^{m_1} + \epsilon_r / \epsilon_f]^b = 1$$

$N=1$

ϵ_r / ϵ_f - RATIO OF THERMAL EXPANSION MISMATCH STRAIN TO FAILURE STRAIN

w_N / w_c - RATIO OF WEIGHT GAIN AFTER CYCLE N TO CRITICAL WEIGHT GAIN FOR ONE CYCLE FAILURE

m - EXPONENT EQUAL TO UNITY IF STRAIN INCREASES IN A LINEAR MANNER WITH WEIGHT GAIN

b - SUBCRITICAL CRACK GROWTH EXPONENT

N_f - CYCLES TO FAILURE

FORM OF EXPRESSION FOR PREOXIDATION

$$N_f = [(1 - \epsilon_r / \epsilon_f) (w_N / w_c)^m + \epsilon_r / \epsilon_f]^{-b}$$

FIT OF HIGH HEAT FLUX DATA USING OXIDATION MODEL

CS-85-1074

Figure 17.

CONCLUSIONS

- MODERATELY OXIDIZED 0.025 cm $\text{ZrO}_2 - 7\% \text{Y}_2\text{O}_3$ TBCs TOLERATE HIGH HEAT FLUX
- TBC LIFE A VERY STRONG FUNCTION OF AMOUNT OF PREOXIDATION
- MODEL DEVELOPED FOR LOW HEAT FLUX MAY BE ADEQUATE FOR HIGH HEAT FLUX

FUTURE NEEDS

- WEIGHT GAIN MEASUREMENTS
- ADDITIONAL POINTS BETWEEN 10 AND 15 HOUR PREOXIDATION
- COMPLEMENTARY PREOXIDATION/INERT FURNACE EXPERIMENTS
